Gaming in Learning

- User browsing a retailer's website

Gaming in Learning

- User browsing a retailer's website
- Retailer observes a number of different behaviors X

Gaming in Learning

- User browsing a retailer's website
- Retailer observes a number of different behaviors X
- Wants to figure out which users to give a coupon to

Gaming in Learning

- User browsing a retailer's website
- Retailer observes a number of different behaviors X
- Wants to figure out which users to give a coupon to
- Specify this as a prediction problem $y = f(X)$

Gaming in Learning

- User browsing a retailer's website
- Retailer observes a number of different behaviors X
- Wants to figure out which users to give a coupon to
- Specify this as a prediction problem $y = f(X)$

Gaming in Learning

- User browsing a retailer's website
- Retailer observes a number of different behaviors X
- Wants to figure out which users to give a coupon to
- Specify this as a prediction problem $y = f(X)$

Customer Journeys Are Complex

Gaming in Learning

- User browsing a retailer's website
- Retailer observes a number of different behaviors X
- Wants to figure out which users to give a coupon to
- Specify this as a prediction problem $y = f(X)$

Customer Journeys Are Complex

So, what's the problem?
